ABSTRACTED-PUB-NO: JP 59029310A

BASIC-ABSTRACT:

In the mfr. of bushings which has a base portion (10), through which a cord (A) passes and a guide (20) following the base portion, the base portion is formed in close contact with the cord to prevent slide of cord and the guide is provided with a clearance between it and the cord to allow the cord to be bent at the guide.

The lower core (200a) of a split core (200) having cords (A), (A) inserted into its vacities (222a) is set in place in the lower part (100a) of a split mould (100). Fused resin is poured into the mould, and the moulded bushing is released from the mould together with the core, and the core is removed from the cords.

## ABSTRACT:

PURPOSE: To fill in sealing resin quickly and to spread the resin to required parts by making a recess at a part on the outer surface of the wall section where an insertion hole is made, inserting a cord into the insertion hole and press fitting a rubber packing in the recess, and then filling the insertion hole with sealing resin being injected into the recess.

CONSTITUTION: A cord 23 is inserted into an insertion hole 24 opposing to a recess 28 on the side of outer surface. A packing 30 is previously applied in the insertion hole 31. Sealing resin is then injected into the recess 28 and the rubber packing 30 is pushed into the recess 28. An anti-counterflow protrusion 32 is provided on the inner circumferential face of the insertion hole 31 in order to prevent counterflow of sealing resin 33. The packing 30 serves as a piston when being pushed in, and the sealing resin intrudes into the gap between the insertion hole 24 and the cord 23 thus establishing sealing.

TITLE: External drawer and cord sealing structure in resin mold type electric unit - includes seat whose internal diameter is set larger than outer diameter of cord

Basic Abstract Text (1):

NOVELTY - The resin mold type electric unit seals external drawer portion of cord by attaching tube of heat shrink. The internal diameter of seat formed protruding from outside of case is set larger than outer diameter of cord. A crevices (S1,S2) are formed between cord inserted in seat and inner wall of seat and in between cord and heat shrink tube. Resin (R) that fills in the case passes through crevice.
